About the Technology. Dependency Injection is a great way to reduce tight coupling between software components. Instead of hard-coding dependencies, such as specifying a database driver, you inject a list of services that a component may need. The services are then connected by a third party. This technique enables you to better manage future changes and other complexity in your software.

In software engineering, dependency injection is a technique in which an object receives other objects that it depends on. These other objects are called dependencies. In the typical "using" relationship the receiving object is called a client and the passed object is called a service. The code that passes the service to the client can be many kinds of things and is called the injector. Instead of the client specifying which service it will use, the injector tells the client what service to use.

Dependency Injection is a common tool that all NET Core developers are familiar with and probably already have set up in the project they are using their framework for anyways — so exposing it directly is not a big deal. But why did you do it then? I was so preoccupied with whether or not I could, I didn't stop to think if I should.
