In mathematics, an elementary matrix is a matrix which differs from the identity matrix by one single elementary row operation. The elementary matrices generate the general linear group of invertible matrices. Left multiplication by an elementary matrix represents elementary row operations, while right multiplication represents elementary column operations. Elementary row operations are used in Gaussian elimination to reduce a matrix to row echelon form. They are also used in Gauss-Jordan elimin

Elementary Linear Algebra: Echelon Form of a Matrix, Part 1

In linear algebra, two matrices are row equivalent if one can be changed to the other by a sequence of elementary row operations. Alternatively, two $m \times n$ $m \times n$ matrices are row equivalent if and only if they have the same row space. The row space of a matrix is the set of all possible linear combinations of its row vectors.

MATRICES AND LINEAR ALGEBRA (2) Since $(A - AT)^T = AT - A = -(A - AT)$, it follows that $A - AT$ is skew-symmetric. (3) Let $A = B + C$ be a second such decomposition. Subtraction gives $(A + AT) - B = C - (A - AT)$. The left matrix is symmetric while the right matrix is skew-symmetric.

matrix is a matrix which represents an elementary row operation. ("Represents" means that multiplying on the left by the elementary matrix performs the row operation.) In the pictures below, the elements that are not shown are the same as those in the identity matrix.

Inverses and Elementary Matrices

Two matrices are row equivalent if one can be obtained from the other by a sequence of elementary row operations. The matrix in reduced row echelon form that is row equivalent to A is denoted by $\text{rref}(A)$. The rank of a matrix A is the number of rows in $\text{rref}(A)$.

Elementary Row Operations | Problems in Mathematics

An $n \times n$ matrix is called an elementary matrix if it can be obtained from the $n \times n$ identity matrix I_n by performing a single elementary row operation. Properties of Elementary Matrices: a. If the elementary matrix E results from performing a certain row operation on I_m and if A is an $m \times n$ matrix, then the product EA is the matrix that results when this same row operation is performed on A .
